

AI Engineer Evaluation Task

Timeline: 48 hours from receipt

Deliverables:

- Source code (repo link or zipped project)
- 5–10 minute video walkthrough (approach, design, code, demo)
- Short design/architecture notes (1–3 pages)
- Any research notes/ideas and trade-off analysis
- Demo script with CLI/API examples or a small UI

1) Provided Data

A. Table of Test Users

User ID	Name	Team	Persona	Location
eng01	Alex Chen	Engineering	Software Engineer	US
it01	Priya Nair	IT	ITSM Analyst	Germany
sales01	Marco Diaz	Sales	Account Executive	India

B. Personas

- Alex (Engineering) focuses on building and shipping product features, working with design docs and maintaining repos.
- Priya (IT) addresses ITSM tickets, executes infrastructure scripts, and troubleshoots issues with limited access to engineering docs.
- Marco (Sales) drives outbound campaigns, manages proposals, and uses only sales-collateral files and tools.

C. Sample Tasks per Persona

- Engineering (Alex): Feature Development, Production Support
- IT (Priya): Incident/Ticket Resolution, Infrastructure Maintenance
- Sales (Marco): Lead Generation, Proposal Development

2) Scenario & Environment Setup

A GenAI application is deployed in the enterprise. The app connects to two systems via MCP:

- GitHub - Accessible to Engineering(Read & Write) and IT(Read only)
- Local file system with persona-specific folders (Engineering, IT, Sales) - Each folder is accessible only to the corresponding persona.

3) The Task

Objective: Build a task based access pattern model.

1. Map prompts → tasks using historical prompt/goal pairs.
2. Map tasks → persona (and thereby permissions).
3. Each prompt leads to one or more tool calls (GitHub and/or File System).
4. Each tool call results in an action or data retrieval.
5. Use a mock/sample data set.

5) Deliverables & Submission

Submit the following within 48 hours:

- Source code (repo or archive)
- Video walkthrough (5–10 minutes)
- Design/architecture notes
- Research notes/ideas
- Demo of the solution
